

# Task 1: Scan Your Local Network for Open Ports

This document describes the installation and usage of Nmap on a VirtualBox running Parrot OS. It details how Nmap was installed on the virtual machine and demonstrates its use to perform a TCP SYN scan on the local network IP range. The specific command used is:

```
nmap -sS 192.168.1.0/24
```

This command performs a stealthy TCP SYN scan across the subnet `192.168.1.0/24`, targeting all IP addresses from `192.168.1.0` to `192.168.1.255`. It helps identify active hosts and open ports by sending SYN packets without establishing full TCP connections. This process is useful for network discovery, security auditing, and mapping devices in the local network environment within the Parrot OS virtual machine.

## Here's the scanning outcome:

```
─[user@parrot]─[~]
```

```
└─$sudo su
```

```
─[root@parrot]─[/home/user]
```

```
└─#nmap -sS 192.168.1.0/24
```
